Teorema da Amostragem

Alteração da Taxa de Amostragem utilizando um
procedimento em tempo discreto

OBJETIVO

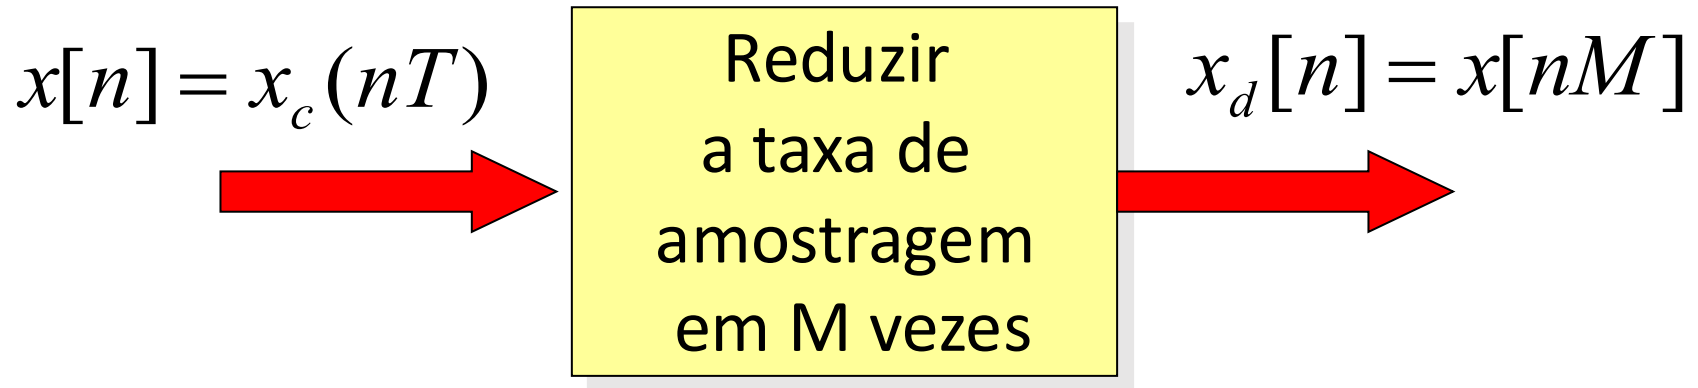

- Modos:

- Reconstruir $x_c(t)$ e reamostrar a T_d segundos
 - Problemas: A/D, D/A, filtros
- Processar $x[n]$ diretamente

DECIMAR POR UM FATOR INTEIRO M

- Decimar ou subamostrar por um fator M

- Equivale a manter uma em cada M amostras do sinal

$$x_d[n] = x_c(nMT) = x_c(nT_d)$$

$$T_d = MT$$

DECIMAR POR UM FATOR INTEIRO M

- Decimar ou subamostrar por um fator M

DECIMAR POR UM FATOR INTEIRO M

- No domínio da frequência

$$x[n] \overset{F}{\longleftrightarrow} X(e^{j\omega})$$

$$x_d[n] \overset{F}{\longleftrightarrow} X_d(e^{j\omega})$$

$$X_d(e^{j\omega}) = \frac{1}{M} \sum_{k=0}^{M-1} X(e^{j(\omega - 2\pi k)/M})$$

DECIMAR POR UM FATOR INTEIRO M

$$X_d(e^{j\omega}) = \frac{1}{M} \sum_{k=0}^{M-1} X(e^{j(\omega-2\pi k)/M})$$

$$M=2$$

$$X_d(e^{j\omega}) = \frac{1}{2} \sum_{k=0}^1 X(e^{j(\omega-2\pi k)/M}) = \frac{1}{2} [X(e^{j\omega/M}) + X(e^{j(\omega-2\pi)/M})]$$

$\omega_N < \pi/M$: Sem aliasing

ALIAS $M=3, \omega_N=2\pi/3$

$$X_d(e^{j\omega}) = \frac{1}{M} \sum_{k=0}^{M-1} X(e^{j(\omega-2\pi k)/M})$$

$$X_d(e^{j\omega}) = \frac{1}{3} X(e^{j\frac{\omega}{3}}) + \frac{1}{3} X(e^{j\frac{\omega-2\pi}{3}}) + \frac{1}{3} X(e^{j\frac{\omega-4\pi}{3}})$$

$\omega_N > \pi/M$: Aliasing

ANTIALIASING

DECIMAÇÃO

INTERPOLAR POR UM FATOR INTEIRO L

- Equivale a introduzir L-1 amostras novas entre cada par de amostras

INTERPOLAR POR UM FATOR INTEIRO L

INTERPOLAR POR UM F

$$x_e[n] = \sum_{k=-\infty}^{\infty} x[k] \delta[n - kL]$$
