Processamento Digital de Sinais - Aula 9

DFT - Propriedades

TRANSFORMADA DISCRETA DE FOURIER - DFT

- Se $x(n)$ é um sinal de tempo discreto, causal e de comprimento L
Transformada discreta de Fourier

$$X(k) = \sum_{n=0}^{N-1} x(n) e^{-j\frac{2\pi k}{N}n}, \quad k = 0, 1, \dots, N-1 \quad \Rightarrow \text{Eq. de Análise}$$

N é o número de amostras da DFT e $N \geq L$

$$x(n) = \begin{cases} \frac{1}{N} \sum_{k=0}^{N-1} X(k) e^{j\frac{2\pi k}{N}n}, & n = 0, 1, \dots, N-1 \\ 0, & \text{caso contrário} \end{cases} \quad \Rightarrow \text{Eq. de síntese}$$

DFT E IDFT (REPRESENTAÇÃO MATRICIAL)

- Para simplificar a notação, define-se:

$$W_N = e^{-j\frac{2\pi}{N}}$$

$$X(k) = \sum_{n=0}^{N-1} x(n) e^{-j\frac{2\pi k}{N}n}$$

- As transformadas podem ser escritas como:

$$X(k) = \sum_{n=0}^{N-1} x(n) W_N^{kn}, k = 0, 1, \dots, N - 1$$

$$x(n) = \sum_{K=0}^{N-1} X(k) W_N^{-kn}, n = 0, 1, \dots, N - 1$$

PROPRIEDADES DA DFT

- Linearidade

$$N = \max(N_1, N_2)$$

$$x_1(n) \xleftrightarrow{\text{DFT } N \text{ pontos}} X_1(K) \quad x_2(n) \xleftrightarrow{\text{DFT } N \text{ pontos}} X_2(k)$$

$$x_1(n) + x_2(n) \xleftrightarrow{\text{DFT } N \text{ pontos}} X_1(k) + X_2(k)$$

DESLOCAMENTO CIRCULAR

- O deslocamento circular de uma sequência $x(n)$ é definido como:

$$x((n - n_0)_N) = x_p(n - n_0), \quad 0 \leq n < N - 1$$

Em que

$$x_p(n) = \sum_{k=-\infty}^{\infty} x(n - kN) = x((n)_N)$$

DESLOCAMENTO CIRCULAR NO TEMPO

DESLOCAMENTO CIRCULAR

- Pode ser realizado pelo um circulo que contém os valores de uma sequência

PROPRIEDADES DA DFT

- Deslocamento circular no tempo

$$x(n) \xleftrightarrow{\text{DFT } N \text{ pontos}} X(K)$$

$$x((n - m)_N) \xleftrightarrow{\text{DFT } N \text{ pontos}} X(K) W_N^{Km}$$

- Deslocamento circular na frequência

$$x(n) \xleftrightarrow{\text{DFT } N \text{ pontos}} X(K)$$

$$x(n)W_N^{Kl} \xleftrightarrow{\text{DFT } N \text{ pontos}} X((K + l)_N)$$

Convolução linear (revisão)

$$x_3(n) = x_1(n) * x_2(n) = \sum_{k=-\infty}^{\infty} x_1(k)x_2(n-k)$$

$$x_1(n) \xleftrightarrow{\mathcal{F}} X_1(e^{j\omega}) \qquad x_2(n) \xleftrightarrow{\mathcal{F}} X_2(e^{j\omega})$$

$$x_3(n) = x_1(n) * x_2(n) \xleftrightarrow{\mathcal{F}} X_1(e^{j\omega})X_2(e^{j\omega})$$

Convolução linear de duas sequências finitas

$$x_1(n) = [2, 1, 2, 1]$$

$$x_2(n) = [1, 2, 3, 4]$$

$$x_3(n) = x_1(n) * x_2(n) = \sum_{k=-\infty}^{\infty} x_1(k)x_2(n-k)$$

Comprimento de $x_3(n) = L+P-1$

CONVOLUÇÃO CIRCULAR NO TEMPO

$$y(n) = x(n) \otimes_N h(n) = \sum_{l=0}^{N-1} x(l)h((n-l)_N)$$

Na forma matricial tem-se:

$$\begin{bmatrix} y(0) \\ y(1) \\ \vdots \\ y(N-1) \end{bmatrix} = \begin{bmatrix} h(0) & h(N-1) & \dots & h(1) \\ h(1) & h(0) & \dots & h(2) \\ \vdots & \vdots & \ddots & \vdots \\ h(N-1) & h(N-2) & \dots & h(0) \end{bmatrix} \begin{bmatrix} x(0) \\ x(1) \\ \vdots \\ x(N-1) \end{bmatrix}$$

Propriedades da DFT

- Convolução circular de N pontos

$$x_1(n) \xleftrightarrow{\text{DFT de N pontos}} X_1(k)$$

$$x_2(n) \xleftrightarrow{\text{DFT de N pontos}} X_2(k)$$

$$x_1(n) \otimes_N x_2(n) \xleftrightarrow{\text{DFT de N pontos}} X_1(k)X_2(k)$$

Convolução circular de duas sequências finitas

$$x_1(n) = [2, 1, 2, 1]$$

$$x_2(n) = [1, 2, 3, 4]$$

$$y(n) = x(n) \otimes_N z(n)$$

$$\begin{bmatrix} y(0) \\ y(1) \\ \vdots \\ y(N-1) \end{bmatrix} = \begin{bmatrix} x_1(0) & x_1(N-1) & \dots & x_1(1) \\ x_1(1) & x_1(N-2) & \dots & x_1(2) \\ \vdots & \vdots & \ddots & \vdots \\ x_1(N-1) & x_1(N-2) & \dots & x_1(0) \end{bmatrix} \begin{bmatrix} x_2(0) \\ x_2(1) \\ \vdots \\ x_2(N-1) \end{bmatrix}$$

Convolução circular de duas sequências finitas

$$y(n) = x(n) \otimes_N z(n)$$

$$x_1(n) = [2, 1, 2, 1]$$

$$x_2(n) = [1, 2, 3, 4]$$

$$\begin{bmatrix} y(0) \\ y(1) \\ y(2) \\ y(3) \end{bmatrix} = \begin{bmatrix} 1 & 4 & 3 & 2 \\ 2 & 1 & 4 & 3 \\ 3 & 2 & 1 & 4 \\ 4 & 3 & 2 & 1 \end{bmatrix} \begin{bmatrix} 2 \\ 1 \\ 2 \\ 1 \end{bmatrix} = \begin{bmatrix} 14 \\ 16 \\ 14 \\ 16 \end{bmatrix}$$

CONVOLUÇÃO CIRCULAR VERSUS CONVOLUÇÃO LINEAR

- *Convoluções lineares é que possuem interesse prático*
 - *Sistemas LIT's podem ser expressos por convoluções lineares.*
 - *Filtragem é realizada por convoluções lineares*
- *É possível relacionar convoluções circulares com convoluções lineares?*
 - *Possibilitaria o cálculo eficiente de convoluções por DFT's*

CONVOLUÇÃO CIRCULAR VERSUS CONVOLUÇÃO LINEAR

- Sejam $x(n)$ e $v(n)$ sequência com comprimentos L e M , respectivamente
- Pode ser observado que a convolução circular dado por

$$x(n) \otimes v(n)_N$$

é equivalente a convolução linear entre $x(n)$ e $v(n)$ se $N \geq L + M - 1$

COMO UTILIZAR A DFT PARA CALCULAR A CONVOLUÇÃO LINEAR?

- Considere:
 - $x(n)$ com comprimento L
 - $y(n)$ com comprimento K

Convolução Linear usando a DFT

Como utilizar a DFT para calcular a convolução linear?

- Entretanto, se:
 - Uma das sequências for muito longa
 - Processamento muito demorado

??????????

Como utilizar a DFT para calcular a convolução linear?

- **Solução:** Convolução em blocos:

- Método Sobreposição e soma
- Método sobreposição e armazenamento

Método Sobreposição e soma

Método Sobreposição e soma

Método Sobreposição e soma

Método Sobreposição e soma

Método Sobreposição e soma

$$y(n) = x(n) * h(n) = \sum_{r=0}^{\infty} y_r(n - r(P-1))$$

$$y_r(n) = x_r(n) * h(n)$$

Método

soma

$N = L + P - 1$ para cada bloco

Método sobreposição e ar

- Cada bloco com tamanho L .
- $P-1$ primeiras amostras são iguais as $P-1$ ultimas amostras do bloco anterior.
- Calcule a convolução circular de L pontos para cada bloco.
- Descarte as primeiras $P-1$ amostras resultantes.
